News from NSF AgTech Engine in North Dakota

Issue Date: March 2, Newsletter

Message from Dr. Hallie Mackey, NSF AgTech Engine in North Dakota CEO

As we thank Deepa, Jennifer, and Supporters,

Dear Friends, Partners, and Supporters,

In our home state, the phrase "It's blowing snow" is a common warning of hazardous conditions, and a signal to stay indoors.

In our Spring newsletter, we introduced a significant change in leadership. Deepa Pakhale, who served as the Executive Director of the NSF AgTech Engine in ND, has moved on to a new opportunity. Deepa's departure created a vacancy, as well as a chance to reimagine the leadership structure of the NSF AgTech Engine in North Dakota now more powerfully interconnected. A dedicated Executive Director will focus on the day-to-day regional economic, talent sustainability, and support of entrepreneurs, while the CEO leads strategy.

But the new name is not all a clear- it's a hypothetical "blowing snow" warning. It's a reminder that we're in the middle of a transition, and that we're navigating it together.

We've been working hard behind the scenes to ensure we will have excellent ice-impact across North Dakota and beyond.

Whether you're a grower looking to try a new technology, a student exploring a career in agriculture, or a business owner curious about partnering, we're here to help you find your way.

Thank you for growing with us.

Dr. Hallie Mackey
CEO, NSF AgTech Engine in North Dakota

From FARMS to NSF AgTech Engine: Reflecting On Evolving Mission

As we introduced at leadership, NSF AgTech Engine in North Dakota has undergone a change in leadership. Deepa Pakhale, who led the NSF AgTech Engine in ND since its launch, has left to serve as a new opportunity in tech, startups, and financial services. Deepa's departure created a vacancy, as well as a chance to reimagine the leadership structure of the NSF AgTech Engine in North Dakota now more powerfully interconnected. A dedicated Executive Director will focus on the day-to-day regional economic, talent sustainability, and support of entrepreneurs, while the CEO leads strategy.

We're excited to have Jennifer Nelson, who served as the Executive Director of the Northern Crops Institute (NCI) for nearly 20 years, as the Executive Director of the NSF AgTech Engine in ND. Jennifer's leadership at NCI helped to grow the organization's impact and influence in the region, and we're confident that her experience and connections will be invaluable as we work to support the growth of agtech companies in North Dakota.

We're thrilled to have Jennifer on board and look forward to working with her to continue the NSF AgTech Engine in ND's mission of supporting agtech companies and driving economic growth in the region. Please join us in welcoming Jennifer to the NSF AgTech Engine in ND team!

AgTech Engine Welcomes New Team Members
Jennifer Nelson, Executive Director
Rich Jablonski and Alexis Lee

Rick Bitner - Innovation Manager, Research and Development Specialist

Rick's career encompasses a diverse range of experiences in agriculture, technology, and entrepreneurship. He has held roles in international research, public diplomacy, trade, and financial services, including a decade at Cargill. Rick's passion for technology and its role in shaping tomorrow's agriculture is evident in his dedication to staying at the forefront of innovation. His diverse skill set and extensive network position him as a valuable asset to the NSF AgTech Engine.

Jennifer Nelson, Innovation Manager, Scalability and Applications

Jennifer's career has been dedicated to driving innovation and sustainability across agriculture. Originally from Minnesota, she has a deep-rooted passion for agriculture and a wealth of collaborative and entrepreneurial experience. Her organizations such as Farmers for Forestry, the Greenbelt Institute, and the Northern Crops Institute (NCI), where she served as Executive Director for nearly 20 years. Jennifer's leadership at NCI helped to grow the organization's impact and influence in the region. She is excited to join the NSF AgTech Engine and foster investment opportunities, supporting the growth of agtech companies and driving economic development.

Jeff recently took down an impressive solo RPG victory in Paris, France, at the Ludum Dare 57 game jam. Ludum Dare is a 72-hour game jam where participants create a game from scratch based on a theme announced at the start. Jeff's game, Paris Delivery Service, earned an astonishing 3rd place out of 1,500 entries in the RPG category. Congratulations, Jeff!

Alexis Lee, Executive Assistant

Alexis is a graduate of Minnesota State University Moorhead with a degree in Communication Studies. Originally from Minnesota, she has a deep-rooted passion for agriculture. Her experience includes working as a Communications Specialist for Farmers for Forestry, a Greenbelt Institute Intern, and a Legislative Intern for Senator Amy Klobuchar. Alexis's diverse skill set and extensive network position her as a valuable asset to the NSF AgTech Engine.

We're excited to have Jennifer Nelson, who served as the Executive Director of the Northern Crops Institute (NCI) for nearly 20 years, as the Executive Director of the NSF AgTech Engine in ND. Jennifer's leadership at NCI helped to grow the organization's impact and influence in the region, and we're confident that her experience and connections will be invaluable as we work to support the growth of agtech companies in North Dakota.

We're thrilled to have Jennifer on board and look forward to working with her to continue the NSF AgTech Engine in ND's mission of supporting agtech companies and driving economic growth in the region. Please join us in welcoming Jennifer to the NSF AgTech Engine in ND team!

NSF AgTech Engine Launches Wheat Disease Monitoring Network to Protect Crops from Devastating Outbreaks

An AI-powered wheat disease diagnostic system developed by the NSF AgTech Engine in North Dakota is now being deployed across the state's wheat fields, marking a significant step forward in protecting crops from devastating outbreaks. Backed by the NSF AgTech Engine, the system is poised to revolutionize how farmers detect and manage diseases.

The system, developed by a team of researchers led by Dr. Ramesh Kumar at the University of North Dakota, uses a combination of drone-mounted cameras and AI algorithms to identify signs of disease in wheat plants in the field. The team trained the algorithms on a large dataset of images of healthy and diseased wheat plants, allowing the system to accurately detect and classify different disease types, including rust, blight, and powdery mildew.

Dr. Kumar explained the importance of early detection in preventing widespread crop damage. "Wheat diseases can spread rapidly, and by the time they are visible to the naked eye, it's often too late to take effective action," he said. "Our system can detect the earliest signs of disease, giving farmers the opportunity to intervene before it has a chance to spread."

The system is designed to be easy to use, even for farmers with limited technical expertise. Farmers can simply upload images of their wheat fields to a web-based platform, and the AI algorithms will analyze the images and provide a report within minutes. The report includes a map of the affected areas, as well as recommendations for treatment options.

The NSF AgTech Engine is providing funding for the deployment and maintenance of the system, as well as training for farmers and agricultural extension agents. The organization sees this project as a key component of its mission to support innovative technologies that can help farmers improve their yields and reduce their environmental impact.

"We're excited to be working with Dr. Kumar and his team on this project," said Dr. Jane Smith, Director of the NSF AgTech Engine. "This system has the potential to make a significant difference in the lives of farmers across North Dakota, and we're proud to be supporting its development and deployment."

The system is currently being tested on farms in the Red River Valley, where the risk of wheat diseases is particularly high due to the region's humid climate. Early results have been promising, with the system accurately detecting diseases in over 90% of the images it has analyzed.

The team is now working to refine the system and expand its capabilities. They are also exploring the possibility of using the system to detect diseases in other crops, such as barley and canola.

The NSF AgTech Engine's investment in this project is part of a broader effort to leverage technology to address challenges facing North Dakota's agricultural industry. The organization has also invested in projects focused on precision agriculture, robotics, and data analytics.

Williamson Project Shortcoast of ND Water Commission Receives $50M in NSF AgTech Engine Funding

The Innovative Williamston initiative received a $50 million investment from the North Dakota Water Commission (NDWC) on Tuesday, March 15, 2023. The funding, which is part of the NSF AgTech Engine's Water Resources Research Group Program, will support the development of a new water treatment facility in the city of Williamston.

During the Activate Session, Dr. Hollie Mackey, CEO of the NSF AgTech Engine in North Dakota, said features as a panel on the Innovative Williamston initiative. Mackey explained that the partners across the Partnership Advisory Committee (PAC) and Technical Advisory Committee (TAC) to ensure the project's innovation and long-term impact through collaboration.

In his keynote Water Planning Session that was the Executive Director of the NSF AgTech Engine, Dr. Pakhale discussed the project's innovative approach to water treatment and its potential economic benefits. He also highlighted the project's commitment to sustainability and environmental stewardship.

"This project is a testament to the power of collaboration and innovation," Pakhale said. "By bringing together experts from various fields, we can develop solutions that are not only effective but also sustainable and environmentally responsible."

The new water treatment facility will be built on a 10-acre site in the city's industrial park. It will have the capacity to treat 5 million gallons of wastewater per day, which will be used for irrigation and industrial purposes. The facility is expected to create 50 new jobs during its construction and operation.

The Williamston project is the latest in a series of projects funded by the NSF AgTech Engine's Water Resources Research Group Program. The program was established in 2021 to support research and development projects that address water challenges in the agricultural sector.

The NSF AgTech Engine is a non-profit organization that supports the development of agtech companies in North Dakota. It provides funding, mentorship, and other resources to help entrepreneurs bring their ideas to market.

Williamston Project Advances Toward Suitable Water Treatment Solutions

The Innovative Williamston Initiative is making significant progress toward developing suitable water treatment solutions for the region's unique challenges. The project, which is being led by the NSF AgTech Engine in North Dakota, aims to address the issue of high levels of iron and manganese in the area's groundwater, which can pose health risks and damage infrastructure.

In an update from Thursday Water Plan that was held on March 14, 2023, Tanning Ma Foundation for design and construction of a pilot treatment facility. The facility will be capable of treating up to 1 million gallons of water per day and will serve as a testing ground for various treatment technologies.

The project is expected to launch June 1, 2023 from all of the Partnership Advisory Committee (PAC) and Technical Advisory Committee (TAC) to ensure the project's innovation and long-term impact through collaboration.

"Previous research study provided a variety of technical solutions that could be effective in removing iron and manganese from the water," said Dr. Jane Smith, a water treatment expert at the NSF AgTech Engine. "However, there is no one-size-fits-all solution. The pilot facility will allow us to test different technologies and determine which ones are most effective for the specific conditions in Williamston."

By development contractors, the Williamston Project Advisory Committee (PAC) and Technical Advisory Committee (TAC) to ensure the project's innovation and long-term impact through collaboration.

2nd Annual North Dakota Controlled Environment Agriculture Conference Brings Innovation to Wamaeck

The 2nd Annual North Dakota Controlled Environment Agriculture Conference will be held at the Wamaeck Civic Center on March 15th and 16th. The conference is organized by the NSF AgTech Engine in Wamaeck this August.

The NSF AgTech Engine and its partners North Dakota Controlled Environment Agriculture Conference (NDCEAC), the two-day conference gathered students, researchers, and industry professionals to explore the latest energy efficient agriculture.

The conference opened with immersive site visits showcasing cutting-edge technologies. Attendees toured the Wamaeck Civic Center, the NSF AgTech Engine, and Wamaeck Public Schools, and the Wamaeck Public Schools. Participants gained hands-on insights into the practical applications of controlled environment agriculture in real-world settings.

The conference highlighted the critical role of partnerships in driving innovation and economic growth in the agtech sector. Collaborations between industry, academia, and government were emphasized as essential for addressing challenges and leveraging opportunities. Key partnerships that were showcased include the Wamaeck Public Schools, Wamaeck Civic Center, and the NSF AgTech Engine.

Wamaeck Hosts 2nd Annual North Dakota Controlled Environment Agriculture Conference

The Innovation of Wamaeck, a leading, co-host sponsors, was on display at the 2nd Annual North Dakota Controlled Environment Agriculture Conference, which took place on March 15th and 16th at the Wamaeck Civic Center. The conference, co-hosted by the NSF AgTech Engine in North Dakota, "Nicky Tesla."

"Wamaeck has been a leader in this industry for a long time," said Dr. Jane Smith, Director of the NSF AgTech Engine. "We're excited to bring this conference to Wamaeck and showcase the innovation that's happening here."

The conference featured a variety of presentations and workshops on topics such as hydroponics, aquaponics, and vertical farming. Attendees also had the opportunity to tour the Wamaeck Civic Center's state-of-the-art facilities.

One of the highlights of the conference was a keynote address by Dr. Michael Johnson, a professor of agricultural engineering at the University of North Dakota. Johnson discussed the challenges and opportunities facing the controlled environment agriculture industry.

"We're at a critical juncture in this industry," Johnson said. "We have the potential to revolutionize how we grow food, but we need to overcome some significant challenges."

Johnson will join a lineup of presenters including Nicky Tesla, Engage Colleges and Innovations Agency, and economic growth and workforce development experts.

Rural Ranch Pioneering Robotic Shepherding and AI Predator Detection Technology

Rural Ranch, a leading agricultural technology company headquartered in Wamaeck, has launched a groundbreaking initiative to develop robotic shepherding and AI predator detection technology. The project, which is being supported by the NSF AgTech Engine in North Dakota, aims to address the challenges of predator-livestock conflict and labor shortages in the ranching industry.

The initiative will leverage Rural Ranch's expertise in robotics and artificial intelligence to create a system that can autonomously herd and monitor livestock, while also detecting and deterring predators. The system will use a combination of sensors, cameras, and machine learning algorithms to identify and track predators in real-time, and will be able to deploy non-lethal deterrents such as flashing lights and loud noises.

"We're excited to be working with the NSF AgTech Engine and North Dakota on this innovative project," said John Smith, CEO of Rural Ranch. "We believe that our technology has the potential to revolutionize the way ranchers manage their livestock and protect their animals from predators."

The project is expected to take two years to complete, and will involve collaboration with researchers from the University of North Dakota's School of Engineering and Mines. Rural Ranch will also work with local ranchers to test and refine the system in real-world conditions.

In addition to its work on robotic shepherding and AI predator detection, Rural Ranch is also developing a range of other technologies aimed at improving the efficiency and sustainability of ranching operations. These include precision grazing systems, automated feeding systems, and data analytics platforms that can help ranchers optimize their operations.

The company's initiatives are part of a broader trend in the agtech industry, which is seeing increased investment in technologies that can address labor shortages and improve the sustainability of agriculture. According to a recent report by the NSF AgTech Engine, the agtech industry in North Dakota has created over 1,000 jobs in the past five years, and is expected to continue growing rapidly in the coming years.

Canada Thistle Eradication Project Targets Infestations Across 500 Acres in Wamaeck

A new initiative to combat the invasive Canada thistle has been launched in Wamaeck, North Dakota. The project, led by the NSF AgTech Engine in North Dakota, aims to eradicate the thistle from over 500 acres of land in the area. The project is expected to take three years to complete and will involve a combination of mechanical, chemical, and biological control methods.

Canada thistle is a perennial weed that can grow up to 6 feet tall and has a deep taproot that makes it difficult to control. It is native to Europe and Asia, but has become established in North America, where it can cause significant damage to crops and pastures. The weed can reduce crop yields by up to 50% and can also harbor pests and diseases that can affect livestock.

The project is being led by Dr. Jane Smith, a professor of weed science at the University of North Dakota. Smith and her team will be using a variety of methods to control the thistle, including mowing, herbicide application, and the release of biological control agents. The biological control agents will be insects that feed on the thistle and help to reduce its population.

"We are excited to be working with the NSF AgTech Engine on this important project," said Smith. "Canada thistle is a serious problem in our region, and we are confident that we can make a significant impact on the infestations in Wamaeck."

The project is also receiving support from the North Dakota Department of Agriculture and the Wamaeck Soil Conservation District. The NSF AgTech Engine has provided a grant of $250,000 to cover the cost of the project, and the other organizations are contributing in-kind support.

The project will begin in the spring of 2024 and will be completed in the fall of 2026. The team will be monitoring the project's progress and will report on its findings annually.

NSF AgTech Engine Launches Wheat Disease Monitoring Network to Protect Crops from Devastating Outbreaks

An AI-powered wheat disease diagnostic system developed by the NSF AgTech Engine in North Dakota is now being deployed across the state's wheat fields, marking a significant step forward in protecting crops from devastating outbreaks. Backed by the NSF AgTech Engine, the system is poised to revolutionize how farmers detect and manage diseases.
